

AYOBAMI OYESIKU

Game Developer • Gameplay Programmer

Unity | Unreal Engine

Lagos, Nigeria | klausxy117@gmail.com | +234 810 557 8889 | [LinkedIn](#) | [Github](#) | [Portfolio](#)

SUMMARY

Game Developer with **5+ years** of experience **designing** and **developing** games in **Unity** and **Unreal Engine**. Specialized in **Gameplay Programming**, gameplay systems architecture, player movement and combat mechanics, procedural systems, AI behavior, and performance optimization, delivering polished and scalable experiences across both **Indie** and **Studio** environments.

EXPERIENCE

Touche Games [UK]

April 2024 → March 2026

Gameplay Programmer [Unreal Engine]

- **Architected** and implemented **core gameplay systems** for a physics-based Sim-Arcade racing game, establishing a **maintainable and scalable framework** for future features.
- **Designed** and implemented **vehicle physics & handling** (traction, suspension, drift modeling, nitro boosts) balancing simulation realism **with arcade fun**.
- **Collaborated** with **designers** and **artists** to integrate assets seamlessly into the engine, ensuring a polished **user experience**.
- Built and integrated **HUD/UI systems** (tachometer, nitro meter, minimap, lap timers) with **UMG** and **Blueprint-C++** workflows.
- Developed a **data-driven vehicle system** with **Unreal DataTables**, enabling designers to edit stats in Excel and auto-register vehicle blueprints, reducing iteration time for designers by **~30%**.
- **Optimized** code and **rendering performance**, reducing frame time by **~15%** during playtests.

Key skills: Unreal Engine 5, Blueprints, C++, UMG, DataTables, Physics Simulation, Performance Optimization

Clown Ware Studio [NG]

2020 → Present

Independent Game Developer

Project Astro [Unity]

- **Designed** and implemented a **custom player controller** using Unity's Input System, focused on **responsive movement** and **gameplay feel**.
- **Built enemy AI** using a finite state machine (**FSM**) architecture, handling **state transitions** such as spawn, idle, navigation, attack and death behaviors.
- **Developed** a **procedural wave generation system** with adaptive difficulty scaling using a custom **weighted probability algorithm**.
- **Implemented** a **modular combat and weapon system** (Primary, Secondary, Super) with weapon management and interaction support.
- **Created** an **interaction system** for pickups and item usage, enabling dynamic player-world interactions.
- **Developed** a **HUD/UI system** using Unity UI Toolkit to clearly communicate **gameplay states** and player feedback.

Project XoX [Unity]

- **Implemented** a **bullet time system** using coordinated time scale manipulation across the Time, Audio, and Game managers, with float curve-driven transitions to achieve smooth, polished slow-motion entry and exit effects.
- Built a **procedural animation system** using Unity's built-in IK to dynamically position hand placement based on each weapon's defined grip points, allowing any equipped weapon to be held correctly without manual animation setup.
- **Developed** a **dynamic camera system** built on Unity's Cinemachine, handling smooth follow behavior, dynamic FOV adjustments, screen shake, and combat framing to improve gameplay readability and player immersion.

XO 1999 [Unity]

- Built a modern twist on classic Tic Tac Toe, featuring Classic and a new Elimination mode, and shipped it as a playable Android application available on itch.io.
- **Implemented** an **AI opponent** using the **Minimax algorithm**, enhancing difficulty scaling and increasing replay value for players.
- Designed and implemented **touch input controls** optimized for mobile interaction, ensuring responsive and intuitive gameplay on Android devices.
- **Optimized** rendering and memory usage for **lower-end Android hardware**, maintaining stable performance across a range of device specifications.
- Configured the full **Android build pipeline** in Unity, including SDK setup, APK export settings, and build configuration for mobile deployment.

PROJECTS

Pong 117 [WinApi, C++]

[\[Project Link\]](#)

- Designed and developed a fully playable retro-style **Pong clone** from scratch with a **custom game engine**, including a **double-buffered renderer**, input handling, collision detection, custom audio engine, and game loop logic.
- Built stable, **low-level systems** that ensured **smooth frame updates** and **consistent gameplay performance** across test devices.

SKILLS

Programming: C++, C#, Unreal Blueprints, JavaScript

Game Engines: Unity, Unreal Engine 5

Version Control: Git, Plastic SCM (Unity VCS)

3D Software: Blender

UI/UX: UMG, Unity UI Toolkit, Figma

Specialties: Optimization, Rapid Prototyping, Gameplay Systems

COURSES

Memorial University [CND]

Nov 2023 → 2024

COMPSCI 4300 · Introduction to Game Programming

EDUCATION

University of Lagos · B.Sc. Mechanical Engineering

2017 – 2024

Lagos, Nigeria
